- Iridium At Sea
- Inmarsat Mini-M
- Inmarsat C
- Inmarsat Mini-C

Broadband Solution

- WaveCall™ by Telenor

GSM, GPRS, 3G and Blackberry

Mobile telecommunications are now a vital part of inshore communications allowing Captain and crew to work effectively and owners and guests to stay in touch with family and friends.

GSM is the mainstay of telephony and GPRS has proven to be a superb tool for reliable and cost effective data communication. We can supply a wide range of GSM and GPRS services and hardware depending on where the service will be used and the application required. More recently, combined 3G/GPRS wireless routers have become available and allow an entire onboard network to communicate without the expense of using a satellite connection.

* The new 3G service provides high speed connections up to 384 kbps.

Wireless Internet Access

Many marinas around the world now offer wireless internet access. You can pay per day, weekly or monthly and are then able to securely connect to the chosen marina WiFi. Depending on the service provider, you can access up to a 2Mbps connection and generally unlimited data. OceanWeb can advise, supply and install suitable WIFI antennas and boosters plus integrate the WiFi with your existing IT system. We can also install combined WiFi/GPRS/3G routers which provide a compact solution for both GSM and WiFi connectivity.
